

The line cuts the circle at two points

Note:  $2x$   
 ← Variable  
 ↓ Coefficient

Method: To find the two points of intersection of a line and a circle.

- 1) Rearrange the linear equation to get either  $x$  or  $y$  on its own (which ever has no coefficient)
- 2) Substitute the rearranged linear equation into the corresponding variable in the circle equation
- 3) Get rid of brackets and tidy up. Factorize the quadratic equation and solve to find missing values.
- 4) Sub the values found in (3) back into linear equation

Eg 1) A circle  $x^2 + y^2 = 40$  and a line  $x + y - 4 = 0$   
 Find the points of intersection

① Linear Equation  $x + y - 4 = 0$

$+4$	$x + y = 4$	$+4$	In terms of $x$ .
$-y$	$x = -y + 4$	$-y$	$x$ on its own

② Sub in  $x = -y + 4$  into  $x$  part of  $x^2 + y^2 = 40$

$$(-y + 4)^2 + y^2 = 40$$

$$-y(-y + 4) + 4(-y + 4) + y^2 = 40$$

Tidy up and factorize.

③

$$y^2 - 4y - 4y + 16 + y^2 = 40$$

$$-40 \mid 2y^2 - 8y + 16 - 40 = 0 \mid -40$$

$$2y^2 - 8y - 24 = 0$$

Quadratic  
 $\div 2$  to simplify

$$y^2 - 4y - 12 = 0$$

$$(y - 6)(y + 2) = 0 \quad \begin{matrix} +2y \\ -6y \end{matrix}$$

$$(y-6)(y+2) = 0 \quad \begin{array}{l} +2y \\ -6y \\ \hline -4y \end{array}$$

Solve for y

$$\left. \begin{array}{l} y-6=0 \\ +6 \quad | \quad y=6 \quad | \quad +6 \end{array} \right\} \left. \begin{array}{l} y+2=0 \\ -2 \quad | \quad y=-2 \quad | \quad -2 \end{array} \right\}$$

④ Sub the values of y back into the rearranged linear equation

$$x = -y + 4$$

$$\left. \begin{array}{l} y = 6 \\ x = -(6) + 4 \\ x = -2 \\ (-2, 6) \end{array} \right\} \left. \begin{array}{l} y = -2 \\ x = -(-2) + 4 \\ x = +2 + 4 \\ x = 6 \\ (6, -2) \end{array} \right\}$$

**Exercise 2.5**  
Solve the following equations:  
1.  $x^2 + y^2 = 5$   
 $x + y = 3$

34

**Exercise 2.5**  
Solve the following equations:  
2.  $x^2 + y^2 = 10$   
 $x - y = 4$
