

# Integers $Z \{-3, -2, -1, 0, 1, 2, \}$

## ① ADD Integers

$$\left. \begin{array}{l} +7 + 2 = +9 \\ -8 - 4 = -12 \end{array} \right\} \text{Rule:} \\ \text{Add +} \\ \text{keep the} \\ \text{same sign}$$

## ② Subtract

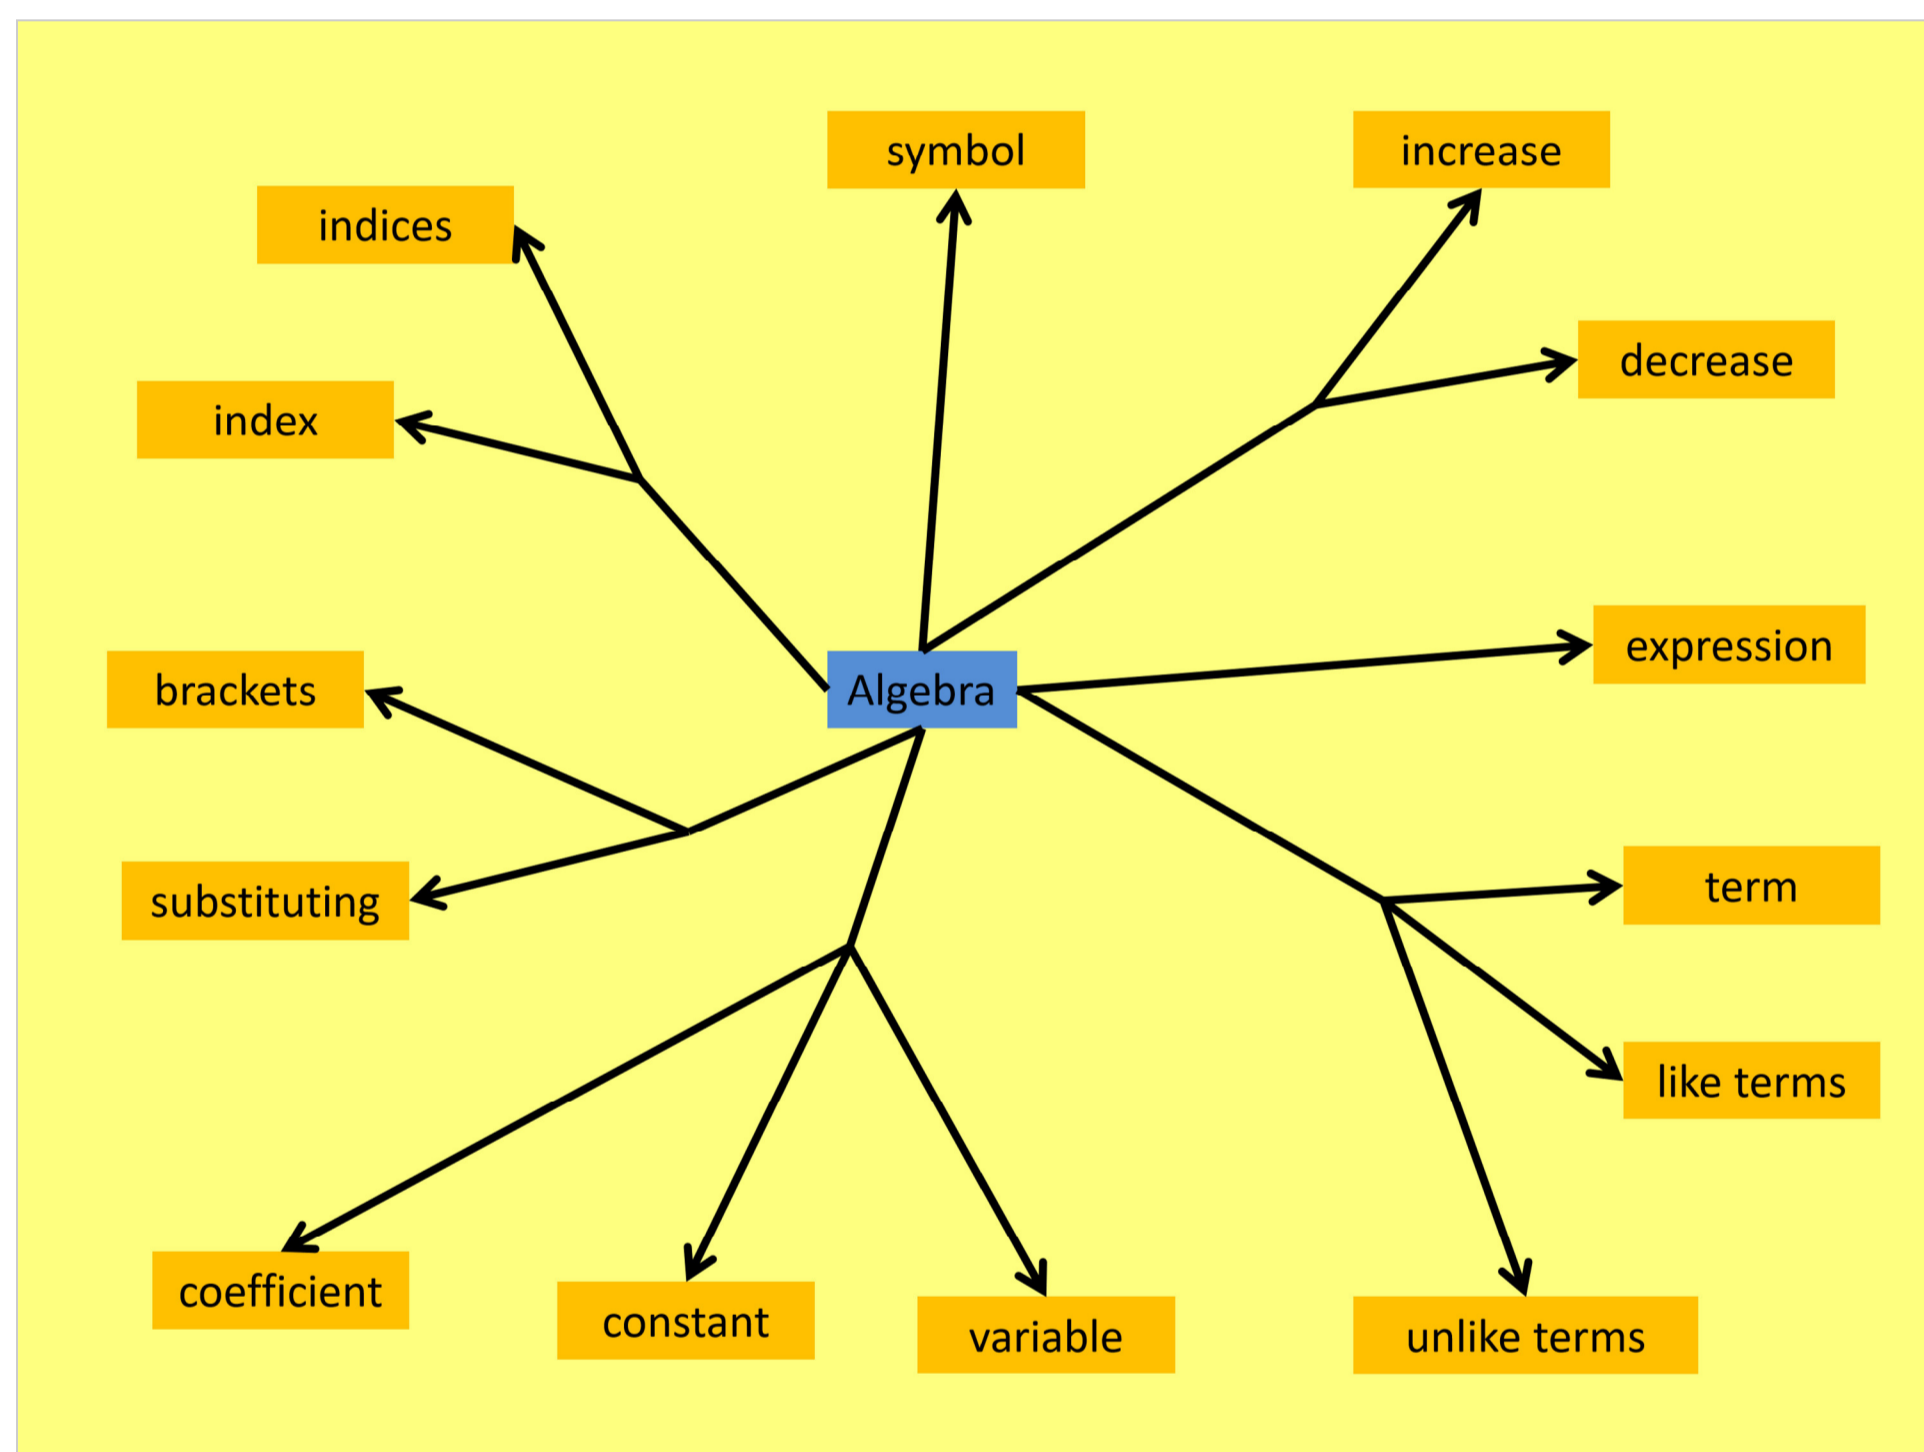

$$\left. \begin{array}{l} -7 + 4 = -3 \\ +11 - 6 = +5 \end{array} \right\} \text{Rule:} \\ \text{subtract} \\ \text{+ keep the} \\ \text{sign of} \\ \text{the bigger} \\ \text{number.}$$

## ③ Multiplication

$$\begin{array}{ll} -1 \times -2 = +2 & \ominus \times \ominus = \oplus \\ +3 \times +4 = +12 & \oplus \times \oplus = \oplus \\ -6 \times +2 = -12 & \ominus \times \oplus = \ominus \\ & \oplus \times \ominus = \ominus \end{array}$$

## ④ Division

$$\begin{array}{lll} \frac{8}{4} = 2 & \frac{\oplus}{\oplus} = \oplus & \frac{-7}{1} = -7 \frac{\ominus}{\oplus} = \ominus \\ \frac{-10}{-5} = 2 & \frac{\ominus}{\ominus} = \oplus & \frac{+11}{-11} = -1 \frac{\oplus}{\ominus} = \ominus \end{array}$$

## Section 6.1

---

Symbols such as  $\blacktriangle$ ,  $\bullet$  or  $\blacklozenge$  are often used to stand for numbers.

Sometimes you can work out the value of the symbol.

Look at this example:

$$\blacktriangledown + 8 = 12$$

We know that  $4 + 8 = 12$ , so this means that  $\blacktriangledown = 4$

You can also use the value of a symbol in a calculation.

If  $\bullet = 7$ , then  $6 \times \bullet = 42$ .

## Writing in symbols

---

'3 more than 5' can be written as  $5 + 3$ .

'6 less than 14' can be written as  $14 - 6$ .

'10 increased by 4' can be written as  $10 + 4$ .

In the same way

'5 more than  $\blacksquare$ ' can be written as  $\blacksquare + 5$ .

'7 more than  $n$ ' can be written as  $n + 7$ .

'8 less than  $x$ ' can be written as  $x - 8$ .

### Exercise 6.1

1. Each symbol stands for a number. Write down its value.

- (i)  $\blacktriangle + 3 = 5$       (ii)  $\blacksquare - 5 = 4$       (iii)  $\boxed{6} \times 2 = 12$       (iv)  $3 + \blacklozenge = 15$   
(v)  $9 - \blacktriangleright = 2$       (vi)  $5 \times \blacksquare = 55$       (vii)  $\boxed{12} \div 3 = 4$       (viii)  $\boxed{30} \div 10 = 3$

$$\begin{array}{l} \cancel{+3} | x - \cancel{5} = 4 \\ x = 9 \end{array} \quad \begin{array}{l} +5 \end{array}$$

$$\begin{array}{l} \text{iii} \quad 2x = 12 \\ \div 2 | x = 6 \end{array} \quad \begin{array}{l} \div 2 \end{array}$$

$$\begin{array}{l} \text{iv} \quad \cancel{3} + x = 15 \\ -\cancel{3} | x = 12 \end{array} \quad \begin{array}{l} -3 \end{array}$$

89

2. Find the value of each of these symbols:

- (i)  $11 - \blacksquare = 3$       (ii)  $14 + \blacktriangleright = 21$   
(iii)  $\blacksquare + \blacksquare = 20$       (iv)  $\blacksquare + \blacksquare + \blacksquare = 30$   
(v)  $\blacksquare - 6 = 14$       (vi)  $\blacksquare \times \blacksquare = 16$   
(vii)  $\blacksquare \times 4 = 20$       (viii)  $\blacksquare \div 6 = 5$

90

3. If  $\square + \blacktriangle = 12$ , find three pairs of values for  $\square$  and  $\blacktriangle$ .

$$\begin{aligned}5 + 7 &= 12 \\10 + 2 &= 12 \\9 + 3 &= 12 \\8 + 4 &= 12 \\11 + 1 &= 12\end{aligned}$$

90

4. If  $\bullet - \blacklozenge = 9$ , find three pairs of values for  $\bullet$  and  $\blacklozenge$ .

$$\begin{aligned}18 - 9 &= 9 & 11 - 2 &= 9 \\12 - 3 &= 9 & 200 - 191 &= 9 \\10 - 1 &= 9 & 20 - 11 &= 9 \\15 - 6 &= 9 \\19 - 10 &= 9 \\14 - 5 &= 9\end{aligned}$$

90

5. If  $\bullet = 5$  and  $\blacksquare = 3$ , find the value of each of these expressions:

- (i)  $\bullet + 6 = 11$    (ii)  $\blacksquare \times 5 = 15$    (iii)  $\bullet - 2 = 3$    (iv)  $7 + \blacksquare = 10$   
(v)  $3 \times \bullet = 15$    (vi)  $6 \div \blacksquare = 2$    (vii)  $30 \div \bullet = 6$    (viii)  $2 \times \blacksquare + \bullet = 11$

6. If  $\blacktriangle = 18$ , write down the value of each of these:

- (i) 6 more than  $\blacktriangle = 24$    (ii) 3 less than  $\blacktriangle = 15$    (iii) twice  $\blacktriangle = 36$   
(iv) five times  $\blacktriangle = 90$    (v)  $\blacktriangle$  less 8 = 10   (vi) twice  $\blacktriangle + \blacktriangle$   
 $36 + 18$   
 $= 54$

7. ■ stands for different numbers. Find its value in each of the following:

(i) ■ + 6 = 10

(ii) ■ - 3 = 5

(iii) 7 + ■ = 14

(iv) 2 × ■ = 22

(v) 36 ÷ 4 = 9

(vi) 3 × ■ = 36

8. ▲ stands for a number. Write down each of these using symbols and numbers only:

(i) 7 more than ▲

(ii) 4 less than ▲

(iii) twice ▲

(iv) ▲ divided by 2

(v)  $\frac{1}{3}$  of ▲

(vi) ▲ less 6

i)  $\Delta + 7$

ii)  $\Delta - 4$

iii)  $2(\Delta)$

or  
 $\Delta \times 2$

iv)  $\Delta \div 2$

v)  $\Delta \times \frac{1}{3}$

vi)  $\Delta - 6$

or  
 $\frac{\Delta}{2}$

or  
 $\frac{1}{3}(\Delta)$

9. The first line in the table below has been completed. Write down what should go in each shaded space in the remaining lines.

	Start number	Change	Result
	3	Increase by 7	$3 + 7 = 10$
(i)	9	Increase by 12	$9 + 12 = 21$
(ii)	12	Increase by 6	$12 + 6 = 18$
(iii)	21	Increase by 8	$21 + 8 = 29$
(iv)	□	Increase by 5	□ + 5
(v)	▽	Increase by 8	▽ + 8
(vi)	●	Increase by 17	● + 17
(vii)	16	Decrease by 3	$16 - 3 = 13$
(viii)	□	Decrease by 12	□ - 12
(ix)	▲	Decrease by 36	▲ - 36
(x)	▶	Decrease by 9	▶ - 9

HIW

10. Each letter stands for a number. What is each number?

(i)  $a + 2 = 6$       (ii)  $b + 3 = 12$       (iii)  $c - 4 = 5$       (iv)  $d - 2 = 9$   
 (v)  $9 - e = 3$       (vi)  $2 \times f = 16$       (vii)  $g + g = 12$       (viii)  $h \div 3 = 6$   
 (ix)  $i + i + i = 12$

HW.

11. Write down what should be written in each of the shaded boxes below.  
The first one is done for you.

	Start number	Change	Result
(i)	$x$	Increase by 6	$x + 6$
(ii)	$a$	Increase by 8	
(iii)	$b$	Decrease by 7	
(iv)	$c$	Double	
(v)	$d$		$d + 9$
(vi)	$e$		$e - 10$
(vii)	$f$	Multiply by 5	
(viii)	$g$		$3g$
(ix)	$h$		$h + k$

Mistake

### Section 6.2 Using Letters

James bought some DVDs but we don't know how many.  
He also has seven of his own.  
We could say that he bought  $x$  DVDs.  
Now he has  $x + 8$  DVDs.

$x + 8$  is an **expression**.  
 $x$  stands for an unknown number.

The expression  $x + x + 2 + 5$  has four **terms**.  
The expression can be simplified to  $2x + 7$  which has 2 terms.  
Notice that  $x + x$  can be added to get  $2x$ .  
 $x + x$  can be added because they are **like terms**.

Consider the cars and vans below:

$$3 \text{ cars} + 2 \text{ cars} = 5 \text{ cars}$$

What is  +  = ?

Three vans and two cars cannot be added as they are not like terms. In algebra, terms with the same letter such as  $2x$  and  $3x$  can be added as they are **like terms**.

Thus  $2x + 3x = 5x$  and  $2y + 4y = 6y$ .

However,  $5x$  and  $7y$  are **unlike terms** and cannot be added.

$2x + 3y + 4$  is an **expression** containing 3 terms. We don't know the values of  $x$  and  $y$ .  $x$  and  $y$  can have different values in another expression.

That is why  $x$  and  $y$  are called **variables**. They are given this name because their values **vary**. The number **4** does not change. Since it is fixed, we call it a **constant**.

In  $2x$ , the number **2** tells us how many  $x$ s there are.

We call **2** the **coefficient** of  $x$ . Similarly **3** is the coefficient of  $y$ .
